

Dear Editor

I am writing to you because I am concerned about global warming. I feel that wind power is the best solution for the big problem of global warming. In short, wind power is great for the next generation.

Wind turbines aren't just better for the environment they also save a great amount of money on bills. Why wouldn't you want a wind turbine?

They are also great because it produces a massive amount of power. They make enough energy to make 170 million cups of tea. That is the same amount of energy as running a computer for 120 million days, wind power is mind-blowing. Not to mention it makes 19% of power in Denmark alone, how amazing!

I feel it is also outstanding that it produces no carbon dioxide. As you know wind power is a lot better for the environment as it produces no carbon dioxide. Power plants, however causes more carbon dioxide than any other power resource. There is also the fact that it doesn't cause epilepsy, isn't it great?

Look around you, is it really worth jeopardising the happiness of the public for a few extra light bulbs?

**Yours faithfully
Milly**
